                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtaine from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from upA (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulindegrading enzyme), KNSLI (Kinesin-like protein 1), LIPA (lysosomal acid lypase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the occurrence of neurodegenerative disease. The genes are all located on chromosome 10. MI is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease, particularly Alzheimer's disease. The present sequence is a PCR primer, which was use in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ss; PCR; inflammation; viral encephalitis; meningitis; multiple sclerosis; stroke; Alzheimer's disease; polycythaemia vera; hyperproliferative myeloid disease; chronic myelogenous leukaemia; HIV infection; autoimmune disease; systemic lupus erythematosus; rheumatoid arthritis; type I diabetes; septic shock; graft rejection; cerebral malaria; cachexia; cardiovascular disorder; angina pectoris; myocardial infarction; hypertension; atherosclerosis; primer; haematologic disease; aplastic anaemia; chronic neutropaenia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18 BP; 3 A; 6 C; 4 G; 5 T; 0 U; 0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid molecule encoding thymotaxin (also known as Tango-45), Tango-63d, Tango-637e, Tango-67, or CC huchordin polypeptide, including sequences 90% identical to them, CC fragments of at least 15 nucleotides and allelic variants. Also included care a host cell or a non-mammalian host cell containing the novel nucleic acid, the encoded polypeptides (or allelic variants, sequences 90% cidentical or fragments), an antibody or antibody substance that containing the novel nucleic selectively binds with one of the proteins, and identifying a compound containing the novel nucleic selectively binds with one of the proteins, and identifying a compound contain the protein and/or modulates the proteins activity. Thymotaxin is a member of the C-C family of chemokines, Tango-63e and -d are members of the tumour necrosis factor superfamily, Tango-67 is a continuous of the containing and treating disorders continuous proteins and treating disorders are useful for diagnosing and treating disorders continuous proteins and treating disorders continuous proteins and treating disorders continuous proteins and treating disorders are useful for diagnosing and treating disorders continuous proteins and treating disorders are useful for diagnosing and treating disorders continuous proteins and treating disease). The polypeptides are useful disease (e.g. viral encephalitis, viral or polypeptides and antitions are disorders in the gene and the continuous leukaemia or polycythaemia vera), HIV infection; autoimmune diseases (e.g. systemic continuous proteins are useful arthritis, type I diabetes, septic shock, and the continuous proteins are useful for generating antibodies, which are therapeutically useful. The mucleic acid molecules are useful for mutations or polymorphisms in the gene. The methods are useful for identifying compounds that modulate the expression or activity of the polypeptides. The present sequence is a PCR primer used to map the Tango-

CC Thymotaxin, Tango-63 and Tango-67 are useful to treat disorders of the CC brain, inflammations, cerebrovascular diseases, tumours, skeletal muscle disorders, motor neuron disorders, myopathies, metabolic diseases of the CC muscle, diseases and disorders associated with the spleen, lung, CC intestine, colon, liver, kidney, reproductive system, ovaries, placenta CC and prostate, and proliferative disorders. Thymotaxin, Tango-63, Tango-67 CC and huchordin are useful to treat heart disorders such as ischaemic heart CC disease, atherosclerosis, hypertension, angina poetoris, hypertrophic CC cardiomyopathy and congenital heart disease, cardiovascular disorders, CC disorders such as leukopenias, leukocytosis and malignant lymphomas, and CC disorders such as leukopenias, leukocytosis and malignant lymphomas, and commune disorders. Tango-63 is useful to treat TNF-related and T cell disorders. Tango-63 is useful to treat TNF-related and T cell

                                                                                                                                                                                                                                                                                               for or the occurrence of neurodegenerative disease comprising detecting in a target nucleic acid obtained from the subject the presence of an allelic variant of polymorphic regions of human genes selected from urokinase plasminogen activator (uPA), gamma-synuclein (SNCG), insulin degrading enzyme (IDE), kinesin-like protein 1 (KNSL1), lysosomal acid lipase (IIPA) and tumour necrosis factor receptor SP6 (TWFRSF6). The method is useful in determining the presence or predisposition to a neurodegenerative disease, particularly Alzheimer's disease. The present sequence is that of a PCR primer which was used for amplification of a region of the human KNSL1 gene in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human; neurodegenerative disease; urokinase plasminogen activator; uPA; gamma-synuclein; SNCG; insulin degrading enzyme; IDE; kinesin-like protein 1; KNSLI; lysosomal acid lipase; LIPA; tumour necrosis factor receptor SF6; TNFRSF6; Alzheimer's disease; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining a predisposition for or the occurrence of neurodegenerative disease, particularly Alzheimer's disease, comprises determining the presence of a polymorphism in the uPA, SNCG, IDE, KNSL1, LIPA or TNFRSPE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens

The invention involves detecting the presence or absence or melanoma. The invention involves detecting the presence or absence or or more polymorphic variations associated with melanoma in the neuropi or more polymorphic variations associated with melanoma in the neuropi or more polymorphic variations (MRC2) genes. The method of the invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identifying subjects at risk and treating invention is useful for identification in the invention is useful for identification in the invention is useful for identification in the invention in the invention is useful for identification in the invention in the invention is useful for identification in the invention in the invention is useful for identification in the invention in the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a subject at risk of melanoma, useful for treating melanoma, comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2004-411720/38.

Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic be used to down agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, dignard the polypeptides encoded by them may be used in the prevention of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; Page 56; 2653pp; English

AAI73060 to AAI79867 represent isolated human polymorphic polymucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by

CC AAM53114 to AAM5329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases comple, (I) may be used to treat disorders by rectifying mutations or completions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own complements of polypeptides and production of polypeptide. Additionally, (I) and its complementary complements and shape be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and complements the presence of similar nucleic acids in samples, and complements the production of polypeptides encoded by (I) may be used as antigens in the production of complements of polypeptides encoded by (I) may be used as antigens in the production of the used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic complements and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic

For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic colypeptides and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary

                                                                                                                                                                                                                                 AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      09-NOV-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 51 BP; 10 A; 15 C; 15 G; 11 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic because as diagnostic agents for detecting the presence of polymorphic
polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also
                                                                                                                                                                                                                                                              sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 51
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         be used as diagnostic agents polypeptides in samples
                                                                                                                                                                                            This antisense oligonucleotide was designed to hybridise to the 3'-UTR human ICAM-1 mRNA. The same sequence was synthesised in phosphodiester and phosphorothioate forms. The oligonucleotides were tested for inhibition of ICAM-1 expression on the surface of interleukin-1-beta-stimulated cells in two different cell lines. The phosphodiester oligonucleotide did not inhibit ICAM-1 expression, but the phosphorothioate (P=S) form did. See AAQ22629-Q22831 and AAQ22633
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAQ22632 standard; DNA; 18

Residues 11 and 12 are linked via an o-xyloso group (i.e. nucleotides that have xylose sugar linked via the o-xylene ring). The sequence is designed to target the Herpes Simplex virus I beginning at nucleotide 10996 and to covalently cross-link to it. See also AAQ20151
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 1992-007480/01.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        microsatellites and MboI sites, the frequency of (76)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. CC The synthetic oligomer is capable of forming a triplex at physiological CC pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is a herpes CC simplex virus I duplex beginning at nucleotide 10996 contg. a purine-rich CC region concentrated on one chain of the duplex. The oligomer, and others CC like it are useful in diagnosis and therapy of diseases characterised by Specific DNA duplex targets, e.g. respiratory syncytial virus, HIV. CC specific DNA duplex targets, e.g. respiratory syncytial virus, HIV. CC form under mild conditions thus assays may be carried out without CC subjecting the test specimen to harsh conditions. The oligomer contains CC an inverted polarity region formed from an o-xyloso dimer synthon. The CC inking gp. is o-xyloso (nucleotides have the 3' positions of xylose CC sugars linked via the o-xylene ring). Two nucleotides are coupled through CC axylene residue to form the dimer synthon. This additional modifications CC may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also CC field 1' 2-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN

                                                                                                                       The sequences given in AAQ61990-2001 are oligonuclectides which contain G4 or G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV), activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper-proliferation, malignancy, cardiovascular disease and snake bite. Oligonuclectides such as these, may be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                              Antisense oligonucleotides which target human ICAM-1 were synthesised in both the phosphodiester and phosphorothioatte forms. The oligonucleotides are useful to treat diseases which are modulated by changes in intercellular adhesion molecules. This sequence corresponds to nucleotides 2849-2866 of the 3'- untranslated region of the human ICAM-1 coding sequence. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAQ44515;

method involves binding the antigen to a solid support and then reacting it with an immunoreactive ligand (L) bound to an oligo; removing any CC unreacted L, and then detecting the presence of the oligo. A similar CC method can be used to detect hys, in which case the ligand is an oligo-CC labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab CC can be detected at very low levels. An exemplary olgi is AAQ75024 which CC can be covalently attached by the 5'- terminus to the N-or C-terminal of CC oligo AAQ75024 using disuccinimidyl suberate. Serum samples suspected to CC contain HEV Abs were immobilised on plastic tubes or wells, then CC incubated for 30-60 mins with the peptide-oligo proruct. The vessels were washed; bound oligo was released with 0.2M glycine and amplified in a CC separate tube using as primers AAQ75025 and AAQ75026 in 30 cycles of PCR. CC The amplification product - AAQ75031 - was treated with uracil DNA CC immoblised oligo-dT. (Updated on 25-MAR-2003 to correct PN field')

                                                                                                                                                                                                                                                                                                                                                                                                                                                              New oligomers are claimed which (A) have at least one peptide nucleic CC coding region, 5'-untranslated region or 3'-untranslated region, CC coding region, 5'-untranslated region or 3'-untranslated region of ICAM-1 cor hybridisable to AUG region, coding region, 5'-untranslated region or 3'-untranslated region of VCAM-1 CC region, exon/intron junction region or 3'-untranslated region of VCAM-1. CC The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cellular adhesion and thus as can be used to target RNA and single stranded DNA (ssDNA) to CC antimetastatic agents, anticancer agents, antirhinoviral agents, anti-cc antimetastatic agents, anticancer agents, mantirhinoviral agents, anti-cc affinity for complementary single stranded DNA oligomers have high CC affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the resulting double helix or with the cc first PNA strand. The PNAs possess no significant charge and are water couldness of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proceases. The present sequence targets human cc intercellular adhesion molecule-1 (ICAM-1) 3' untranslated region
                                                                                                                                                                                                                       RESULT 2047

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM intervals throughout the human genome which can be detectably labelled. The MMS are collections of the primers correspond to the unique genotyping, esp. fluorescence-based. The primers correspond to the unique CC genotyping, esp. fluorescence-based. The primers correspond to the unique CC DNA sequence surrounding each marker, and PCR is used to detect each component of the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising clabelled primers for PCR amplification of the DNA. Group 4 primer pairs care shown in AAQ95465-480 and AAQ95559-590. The chromosomal markers, published size range of the allele and degree of heterozygosity in the population for the markers covered by these primer pairs are not given in

These sequences can be used in a composition for treating allograft rejection. The composition contains one of these sequences in combination with an immunosuppressive agent. The immunosuppressive agent used in the compositions is brequinar, rapamycin, anti-lymphocyte serum, a monoclonal antibody against LFR-1 on antisense oligonuclectide. The compositions can be used for treating or preventing allograft rejection, such as cardiac or renal allograft rejection. By using these compositions, allograft survival times are extended, and donor-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAT30211-T30233, AAT33058-T33112 and AAT36667-T36684 represent antisense oligonucleotides of the invention. These sequences target regions of the coding sequences for human intercellular adhesion molecule-1 (ICAM-1), endothelial leukocyte adhesion molecule-1 (ELAM-1, also known as Eselectin), or vascular cell adhesion molecule-1 (VCAM-1). This sequence targets the 3' untranslated region (nucleotides 2849-2866) of ICAM-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 18 BP; 4 A; 1 C; 11 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligo:nucleotide targetted to a nucleic acid sequence encoding ICAM-1, ELAM-1 or VCAM-1 - useful for treating or preventing allo:graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WO9615780-A1

They were used to prime cDNA synthesis from snapdragon (Antirrhinum majus) petal and leaf RNA, and were also utilised in the PCR amplification of plant cytochrome P450 sequences (see also AAT94670-73). A cDNA clone (see AAT94657) encoding flavonoid 3' hydroxylase (see AAW35704) was isolated using a differential display approach. This can be used to manipulate the pigmentation of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ionisation-Fourier transform mass spectrometry. The ions are excited by sustained off-resonance excitation with single shot excitation, and the target fragmented by collisionally activated dissociation by a neutral gas, e.g. carbon dioxide. Alternatively, the excitation and dissociation can be nozzle skimmer dissociation. The method, used in molecular biology and biomedical applications. The method, utilising electrospray ionisation-Fourier transform ion cyclotron resonance mass spectrometry, is extremely rapid and acts directly on the oligonucleotide. The method is effective for a variety of nucleic acid analytes, particularly chemically modified oligonucleotides which have not previously been successfully sequenced. The present sequence represents a phosphorothioate oligodeoxymucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleotide sequence of nucleic acid analytes, including chemical modified oligonucleotides. This new method utilises electrospray
and formulated with a carrier. A compound comprising this nuclease resistant oligonucleotide can be covalently linked to an antibiotic. The method is used to treat infections by a wide variety of Gram-positive and Gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in immuno-compromised individuals (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                        Claim

Apart from therapeutic use, the oligonuclectides can be used to control bacteria in laboratory cultures, foods, beverages and industrial processes. The oligonuclectides are specific for bacteria, without affecting metabolism in mammalian cells. They may also activate RNase H and have a general, non-specific immune-stimulating effect. The oligonuclectides can be administered orally, intranasally, rectally, topically or by injection, optionally coupled to an agent (e.g. carbohydrate or polyamine) that enhances cellular uptake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequenče
                                                                                                                                    A method has been developed for labelling an oligonuclectide having a repeated sequence of (XY)n (where X and Y consists of a combination of adenine and thymine or uracil or guanine and cytosine, and n is an integer of 1 or more ) at the 3'-terminal side in which the repeated sequence is added and extended using a labelled body of the nucleotide constituting the repeated sequence and a DNA polymerase lacked in 5' to constituting the repeated sequence and a DNA polymerase lacked in 5' to a conscience and a constitution of the constitution of the method can be used for detecting a gene. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14-JUN-1999
                                                                                                      3' exonuclease activity. The method can be used for detecting a

The method can be used for detecting a gene. The method can detect a gene in a sensitivity up to ten times higher than prior art methods. The present sequence represents a primer used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAX19942 standard; DNA; 18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta -N3'; or (X)m5'-(gamma)k-Gelta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine or thymine; N = adenine, guanine or thymine; and the repetition of gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides PCR.

```
CC containing an intermediate tandem repeat (ITR) sequence using CC hybridization selection, and comprises: (a) providing several DNA CC fragments, at least one of which contains an ITR sequence, a region of CC the DNA fragment which contains at least one repeat unit consisting of a CC sequence of five, six or seven bases repeated in tandem at least two CC times; (b) providing a stationary support having at least one CC oligonuclectide associated with it, where the oligonuclectide includes a CC sequence of nuclectides which is complementary to a portion of the ITR CC sequence; and (c) combining the DNA fragments with the support under CC conditions where the DNA fragments including the DNA fragment containing CC used to isolate DNA containing pentanuclectide tandem repeat sequences as CC well as to detect target ITR DNA sequences having a low incidence of CC stutter artifacts (no more than 2.4%). The method is particularly in CC used to isolate DNA containing pentanucleotide tandem repeat sequences as CC stutter artifacts (no more than 2.4%). The method is useful in DNA CC nyofiling for linkage analyses of the method is useful in DNA containing the DNA fragments method is useful in DNA containing the DNA fragments method is useful in DNA containing the DNA fragments method is useful in DNA containing the DNA fragments method is useful in DNA containing the DNA fragments method is useful in DNA contains and the fragment fragments method is useful in DNA contains the documents method is useful in DNA conta

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     profiling for linkage analysis, criminal justice, paternity testing and other forensic and medical uses. DNA typing is also useful for confirming the lineage of horses, dogs and other prize animals. The invention overcomes problems related to the use of microsatellite loci in DNA profiling. The method can detect polymorphisms with a low incidence of stutter artifacts, which has previously been a problem in interpreting allelic content of loci. The development of markers based on larger repeat units, enables easier separation of the fragments on

inhibit retroviral replication. The oligoarabinonucleotides can also be used, in combination with RNase H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinonucleotides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target as RNA, but not complementary ss DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligoarabinonucleotides. Sequences AAZB7160-ZB7164 represent oligoarabinonucleotides containing beta-D-arabinose used in an exemplification of the present invention oligoarabinonucleotides are used for antisense inhibition of gene expression or to prevent DNA replication, or reverse transcription of RNA by retroviruses. The compositions are therefore particularly used to can hybridise to either a a single-stranded (88) RNA to induce RNAse I cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple helix, thereby inhibiting DNA replication and/or transcription. The The invention relates to a new composition for selective, so specific inhibition of gene transcription and expression in composition comprises oligonuclectides containing arabinose ression in a host. The arabinose sugars that

The oligoarabinonucleotides can also be used, in combination with RNase H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinonucleotides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target ss RNA, but not complementary ss DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligonucleotides. Sequences AAZ87160-Z87164 represent oligoarabinonucleotides containing beta-D-arabinose used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication.
                                                                                                                                                                                                                                                                                                                                               2'-deoxy-2'-fluoro-beta-D-arabinose; antisense; inhibition; transcription; expression; reverse transcription; viral repRNase H cleavage; triple helix formation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple helix, thereby inhibiting DNA replication and/or transcription. The oligoarabinonucleotides are used for antisense inhibition of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  composition comprises oligonucleotides containing can hybridise to either a a single-stranded (ss) F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a new composition for specific inhibition of gene transcription and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 1; Page 29; 91pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 expression or to prevent DNA replication, or reverse transcription of RNA by retroviruses. The compositions are therefore particularly used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC oligoarabinonuclectides are used for antisense inhibition of gene capression or to prevent DNA replication, or reverse transcription of RNA CC by retroviruses. The compositions are therefore particularly used to inhibit retroviral replication. The oligoarabinonuclectides can also be CC used, in combination with RNase H, as reagents for sequence-specific CC cleavage or RNA mapping, and additionally for the study and control of CC gene expression in cells. The oligoarabinonuclectides have excellent CC affinity for RNA, increased resistance to nucleases and show little if CC any non-specific binding to cellular or serum proteins. They target ss CC RNA, but not complementary ss DNA, so may be useful for targetting CC coligoarabinonucleotides containing pyrimidine bases form triple helices CC with significantly higher thermal stability than those produced by normal CC oligonucleotides. Sequences AZEF165-ZEF169 represent CC oligodeoxyarabinonucleotides containing 2'-deoxy-2'fluoro-beta-D-CC arabinose used in an exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 used, in combination with RNase H, as reagents for sequence-specific cleavage or RNA mapping, and additionally for the study and control of gene expression in cells. The oligoarabinonucleotides have excellent affinity for RNA, increased resistance to nucleases and show little if any non-specific binding to cellular or serum proteins. They target ss RNA, but not complementary ss DNA, so may be useful for targetting retroviral genomic RNA to inhibit the early stages of viral replication. Oligoarabinonucleotides containing pyrimidine bases form triple helices with significantly higher thermal stability than those produced by normal oligonucleotides. Sequences AAS07165-Z87169 represent oligodeoxyarabinonucleotides containing 2'-deoxy-2'fluoro-beta-D-arabinose used in an exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 specific inhibition of gene transcription and expression in a host. The composition comprises oligonucleotides containing arabinose sugars that can hybridise to either a a single-stranded (ss) RNA to induce RNase to cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple helix, thereby inhibiting DNA replication and/or transcription. The oligoarabinonucleotides are used for antisense inhibition of gene oligoarabinonucleotides are used for antisense inhibition of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  expression or to prevent DNA replication, or reverse transcription of RNA by retroviruses. The compositions are therefore particularly used to inhibit retroviral replication. The oligoarabinonucleotides can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Therapeutic composition containing antisense oligonucleotides that include arabinose sugars, particularly for inhibiting viral replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Damha MJ,

Cytotoxic dermatischeria gravis dermatischeria gravis, pemphigus

Cytotoxic dermatischeria gravis dermatisc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense oligonucleotides are targeted to a nucleic acid encoding a cellular adhesion molecule (2AM) and is capable of modulating the expression of the CAM. They particularly inhibit intercellular adhesion molecule-1 (ICAM-1), vascular cell adhesion molecule-1 (VCAM-1), or endothelial leukocyte adhesion molecule-1 (ELAM-1). The antisense oligonucleotides can be used to modulate CAM activity in mediating cell:cell interactions and subsequent cellular and biological responses, e.g. T cell activation, leukocyte transmigration and inflammation. The antisense sequences can be used for modulating the synthesis of a CAM. They can be used for treating an animal suspected of having or being prome to a disease or condition associated with a CAM. Oligonucleotides targeted to ICAM-1 can be used for treating an inflammatory disease or condition associated with a CAM. Oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense oligonuclectides, used for treating e.g. inflammatory conditions, psoriasis, graft rejection, cancers, infections, cardiovascular disorders or autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 10; Page 174; 199pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for predicting susceptibility to C HIV infection or HIV progression in a subject. The method involves detecting a polymorphism in a human interleukin-10 (LI-10) promoter, where the presence of the polymorphism indicates susceptibility to HIV infection or HIV progression. The method provides prognostic information to persons infected with HIV virus and is useful to help select treatments (such as administration of IL-10 or gene therapy with IL-10). The presence of polymorphism is useful as predictor that very aggressive treatment could substantially eradicate the virus from the infected person. The method is useful for the generation of normograms or other predictive algorithms that can be used, in association with allele status, to prognose probable survival or years to development of AIDS following HIV serconversion. It indicates that increased expression of the IL-10 gene helps to reduce HIV-1 infection and pathogenic progression and enables a variety of new therapeutic interventions in the treatment of HIV disease. The present sequence represents a short tandem repeat (STR) primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hypertrophic cardiomyopathy, angina pectoris, myocardial infarction, cardiac arrhythmia, arteriosclerosis, kidney diseases such as acute renal failure, renal glucosuria, renal infarction, nephrogenic diabetes cardiare, renal glucosuria, renal infarction, nephrogenic diabetes. Consipidus, polycystic kidney disease, hereditary nephritis and inflammatory diseases such as asthma, autoimmune diabetes, tumour angiogenesis, rheumatoid artritis, osteoarthritis, toxic shock syndrome, asthma, stroke, neural trauma, psoriasis, cerebral malaria, osteoporosis, crohn's disease, ulcerative colitis, Alzheimer's disease. Secreted protein DNA is useful in antisense-mediated gene inhibition and in gene therapy. An array comprising one or more oligonucleotides complementary to reference RNA or DNA encoding the secreted factor is useful for detecting cardiac, kidney and inflammatory disease. The present DNA sequence is an oligonucleotide which is used in the preparation of a normalised cDNA library containing secreted factor DNAs. The normalised cDNA libraries are used in the identification of differentially expressed rat secreted factor p0018_D12 gene

The secreted factor is differentially expressed in certain disease states. Secreted protein, its antibodies, antagonists or compositions comprising them are useful in the diagnosis and treatment of cardiac diseases such as congestive heart failure, myocarditis, bungletten the cardiac contents of the cardiac diseases such as congestive heart failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel secreted factor encoded by clone P00188D12 which is expressed in certain disease states, useful in diagnosing cardiac, renal or inflammatory diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to an array of proteins (antibody mimics) comprising a fibronectin type III domain having a randomised loop, a randomised beta-sheet, or their combination, and has the capacity to bin to a compound that is not bound by a corresponding naturally-occurring fibronectin, immobilised onto a solid support. The antibody mimics is useful for detecting a compound preferably a protein, in a biological sample. It is also useful to detect one or more different analytes simultaneously in a sample. Hence is useful for diagnostic purposes. It is also useful for the purpose of designing proteins capable of binding to virtually any compound of interest. The present sequence is an oligonucleotide A18-2PBG linker used in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fibronectin scaffold protein array for obtaining a protein/compound which binds to a compound/protein, comprises a fibronectin type III domain having a randomized loop, a randomized beta-sheet or their combination.

against tumour antigens, viral antigens (e.g. herpesviridae, retrovirid and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method also useful for preventing cancer, asthma, infectious disease, allergy immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae) present sequence may have a phosphorothioate backbone invention relates to a method for stimulating an immune or

The present sequence corresponds to polylinker DNA of the phagemid vector pCR2.1. It was used in the construction of a normalised rat CNNA library, which was used in an example demonstrating differential expression of a rat gene referred to as clone P00210D09. The invention relates to a polypeptide comprising a sequence of at least 80% identity to residues 22 -122 of the present sequence, or a sequence encoded by a nucleic acid hybridsing under stringent conditions to the complement of the coding region comprising 1031 nucleotides, and having at least one biological activity of the polypeptide encoded by clone P00210D09. The polypeptides and polymucleotides of the invention are useful for the treatment of cardiac, renal and inflammatory diseases. The polymucleotides are useful in assays for identifying lead compounds that may be used as therapeutic agents in the treatment of cardiac, kidney or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Phagemid vector; pCR2.1; rat; secreted factor; P00210D09; cardiant; nephrotropic; antiinflammatory; gene therapy; cardiac disease; renal disease; inflammatory disease; polylinker; ss.

                                                                                                                The present invention provides oligonucleotides, and methods for their use, which are useful in modulating the action of proteins involved in gastric acid production. The target protein is preferably the histamine H2 receptor or one of the proteins which form part of the gastric proton pump. The sequences and methods of the invention are useful in the treatment of gastric reflux, gastritis, dyspepsia, stomach ulcers, duodenal ulcers and other gastric acid disturbances, most of which are caused by Helicobacter pylori
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 18 BP; 0

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid sample by consists by association analysis the genotype of an individual or group of CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC aused by one or more SNPs. Phenotypic trait is include diseases e.g. CC osteogenesis imperfects and acute intermittent porphyria. Phenotypic CC traits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimune cliseases, including, rheumatoid arthritis, multiple sclerosis, include control of the present sequence and infection by pathogenic control of the method is also useful in forensic investigations and conternity analysis. The method is also useful in forensic investigations and conternity analysis. The present sequence represents a PCR primer specific content in the present sequence contents and contents of the pr

Craire strain (NURE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CR SNP flanking sequence, the SNPE primer is used as genotyping primer. CR The oligonucleotides of the invention. The PCR primers are used to amplify a CR SNP flanking sequence, the SNPE primer is used as genotyping primer. CR criming a single-nucleotide primer extension reaction. The CR oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CR oligonucleotides are useful for determining the presence, absence or CR identity of a SNP and for genotyping nucleic acid samples, for e.g. to CR assess by association analysis the genotype of an individual or group of craits speciation analysis the genotype of an individual or group of craits include diseases e.g. CR agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CR disease of which a component is or may be genetic such as autoimmune CR disease of which a component is or may be genetic such as autoimmune CR disease, including, rheumatoid arthritis, multiple sclerosis, criminamation, cancer, nervous system diseases and infection by pathogenic inflammation, cancer, nervous system diseases and infection by pathogenic confirmation and processed and processed and pathogenic and component is also useful in forensic investigations and component sequence represents a PCR primer specific for a human syndrome.
                                                                                                                                          Matches
                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; s

                                                                                                                                                                                                                                                                                                                                                                                                                                includes kits for determining the presence or absence of a SNP, using the coligonuclectides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonuclectides are useful for genotyping a nucleic acid sample by performing a single-nuclectide primer extension reaction. The oligonuclectides are useful for determining the presence, absence or cligonucleotides are useful for determining the presence, absence or cligonucleotides are useful for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include disease e.g. dystrophy, familial hypercholesterolaemia, polycystic kidney disease, dystrophy, familial hypercholesterolaemia, polycystic kidney disease, of traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis,
                                                                                                                       Query Match

                                                                                                                                                                                           CC primer extension (SNPE) primers, and the sequences of regions flanking controlled the present invention controlled the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CR SNP flanking sequence, the SNPE primer is used as a genotyping primer. CR The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CR primers by association analysis the genotyping and for e.g. to complete the sneed of a single-nucleotide primer extension reaction. The CR cindividuals, having a pathological phenotypic trait suspected of being cassess by association analysis the genotypic trait suspected of being cassed by one or more SNPs. Phenotypic trait suspected of being cassed by one or more SNPs. Phenotypic traits include diseases e.g. co of teogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial controlled symptoms of or susceptibility to multifactorial conformation. Cannor nervone extension and issaes and inferior hyperthonesis, including, rheumatoid arthritis, multiple sclerosis, traits cannor in carnor nervone extensions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia;

                                                                                                                                The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide CC AGT02013. This is one of a set of oligonucleotides (see ABA91527-30) used CC to assess the minimum number of ribonucleotides in DNA-RNA chimeric CC oligonucleotides required for RNase H cleavage. Each oligonucleotide of CC The oligonucleotides were mixed with target DNA oligonucleotide AGT02009 (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30 (minutes. The results showed that 4 ribonucleotides were mixed the minimum CC number for RNA cleavage. The invention provides probes for nucleic acid Chybridisation. The probes form a hairpin structure comprising a double-stranded stem and a single-stranded loop, and are capable of both CC intramolecular and intermolecular hybridisation. The double-stranded stem CC RNase H cleavage. When the probe hybridises with a target DNA, the RNA CC RNase H cleavage when the probe sensitive to RNase H treatment and CC can be removed. Arrays and methods for nucleic acid hybridisation using C the probes are provided

The method involves coamplifying a set of 3 microsatellite loci. CC comprising a specific mononucleotide repeat locus selected from the group CC consisting of BAT-25, BAT-26, BAT-40, MONO-11 and MONO-15 and two CC tetranucleotide repeat loci selected from FGA, DIS518, DI7S1299 etc from CC asample of genomic DNA and determining the size of the amplified CC fragments. The method is useful for analysing microsatellite loci and for CC detecting microsatellite instability (MSI) in genomic DNA. The CC instability in the set of microsatellite loci are used in prognostic CC tumour diagnosis for the diagnosis of familial tumour predisposition. It is also used to detect cancerous tumours in the gastrointestinal system CC and of the endometrium. The cancerous tumours are preferably from a CC colorectal cancer. The present DNA sequence is a PCR primer which is used CC exemplifying human MONO-15 locus. This primer is used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for diagnosis of a disease or susceptibility to a disease associated with abnormal cell-cell adhesion between epithelial cells, comprising detecting a mutation in a nucleic acid encoding an adhesion protein, a protease or a protease inhibitor, or modulated level of adhesion protein, protease or protease inhibitor, or its fragment polypeptide. The method is useful for diagnosing a disease such as eczema, contact dermatritis, lung atopic asthma, post viral asthma, bronchial hyper-reactivity, chronic obstructive pulmonary disease, Crohn's disease, ulcerative colitis, coeliac disease, peptic ulceration, impetigo, viral warts, meningitis, skin melanoma, squamous cell carcinoma, basal cell carcinoma, cutaneous lymphoma, skin cancer, malignancy of the gastrointestinal tract, malignancy of the lung, psoriasis, acne vulgaris and psoriasis vulgaris. The sequences are useful for treating cardiac, renal or inflammatory diseases. These include cardiac disease such as congestive heart failure, myocardial infarction, cardiac arrhythmia, pulmonary hypertension, arteriosclerosis, atherosclerosis cardiac tumours, renal diseases such as glomerulonephritis, nephrotic syndrome, renal infarction, hereditary nephritis, polycystic kidney disease, chronic renal failure, renal vein thrombosis and medullary sponge kidney and inflammatory diseases such as asthma, rheumatoid arthritis, osteoarthritis, stroke, psoriasis, restenosis, graft versus host reaction, Crohn's disease, ulcerative colitis and Alzheimer's disease. Sequences AAS9463-AAS9475 represent cDNA clones, which encothe secret of feature proposed the content of the conten

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid timour growth,
                                                                                            tumour metastasis; precancerous lesion; rneumatoru artification; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; oSler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiotibroma, wound granulation, incestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibiting angiogenesis in a subject, involves administering antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, theumacoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeouscularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibiting angiogenesis in a subject, antiangiogenic nucleic acid molecule

Arraying genome clones.

Claim 4; Page 5; 528pp; Japanese.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      amplified product to plates containing to of the markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent
                            The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primers for human chromosome 1036-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11-APR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABL44445 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 JP2001321190-A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  are detected from the amplified products; (h) the clones in the multiwe plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1p36-35 DNA, and ABL43233 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
second strand cDNA synthesis through a mechanism of terminal second strand cDNA synthesis through a mechanism of terminal continuation. In the method an RNA molecule is obtained and a first primer is added that comprises a region that hybridises to a complementary region of the molecule before a second primer is added comprising at least one riboguanine at the 3' end of the primer. A first complementary nucleic acid molecule is synthesised, the RNA molecule and second primer are removed and a second complementary nucleic acid molecule is synthesised to form a second hybrid with an extension product of the third primer bound to the first complementary molecule. The method of the invention is useful for increasing the efficiency of second strand cDNA synthesis and may be used for linear amplification of genetic signals from histologically stained tissue. The present sequence
